| Indian Institute of Technology, Jammu | 2024 – 2028 |
| B.Tech.                               | CGPA: 8.11  |

PROJECTS

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                               |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| <div>Ember - Redis-inspired in-memory datastore.</div> <div>Rust, TCP Sockets</div> <div><div>– Built a Redis-compatible in-memory datastore with RESP protocol support over raw TCP sockets.</div><div>– Designed concurrent request handling architecture achieving ~180k requests/sec in local benchmarks.</div><div>– Implemented RDB-style snapshot persistence and recovery for crash-safe restarts.</div><div>– Added TTL expiration with lazy + active eviction strategies and atomic transaction support.</div></div> | <div>Mar. 2026</div> <div>GitHub</div>        |
| <div>Anton - SQL-like database engine</div> <div>Java</div> <div><div>– Built a SQL-like database engine from scratch with custom query parsing and execution.</div><div>– Implemented B+ tree indexing supporting inserts, deletes, and range queries.</div><div>– Explored database internals including indexing, query execution, and low-level storage design.</div></div>                                                                                                                                                 | <div>Oct. 2025</div> <div>GitHub</div>        |
| <div>Vynk - UI Component Marketplace</div> <div>Next.js, TypeScript, React, Tailwind CSS, Commander</div> <div><div>– Built and launched a marketplace for premium UI components and templates with integrated developer tooling.</div><div>– Developed an internal CLI tool to automate component installation and project setup workflows.</div><div>– Achieved 200+ downloads within 36 hours and ~580 daily visitors through organic growth on X.</div></div>                                                              | <div>Jun. 2025</div> <div>GitHub   Live</div> |
| <div>Autotone - Intelligent browser audio normalizer</div> <div>JavaScript, Browser Extensions API</div> <div><div>– Built a browser extension that dynamically balances audio levels across browser tabs.</div><div>– Designed automatic tab-aware volume adjustment for smoother listening across platforms like YouTube and Spotify.</div><div>– Implemented automatic foreground/background tab prioritization for dynamic audio normalization.</div></div>                                                                | <div>Aug. 2025</div> <div>GitHub</div>        |

OPEN SOURCE CONTRIBUTIONS

|                                                                                                                                                                                                                           |
